# Tankwatch

## Fuel Tank Monitoring System

The **Fueltek Tankwatch** is an electronic tank monitoring system that monitors the fluid inside atmospheric tanks. The system is designed to fit new or existing fuel storage tanks and is available in a number of configurations to suit your requirements.

**Tankwatch** will provide you with valuable information regarding your stock movements. The **tankwatch** can provide information locally at the fuel tank via a graphics display or can provide PC based reports. **Tankwatch** can be interfaced with any **FUELTEK** fuel management system.

**Tankwatch** can be configured to monitor a number of things which can affect stock and stock value. In its simplest form the **Tankwatch** will report on the physical contents of the fuel tank ,but can also be configured to monitor and provide information on stock shrinkage due to temperature movements or to establish if short deliveries are being made on regular basis.

Provides real time information on your tank stocks.

- Highlights stock movement .
- Reports on stock shrinkage due to temperature.
- Reports on short deliveries.
- Reports on Ullage.

The system interprets information generated by means of a magnetostrictive probe or a capillary tube inserted in the tank and displays the fluid level fluid height and volume on the graphic display at the tank location . The design guarantees a reliable and repeated level indication.
